

Climate Change

Another big problem for rhinos and other wild animals is the changing **climate**. These changes can cause **droughts**. If water holes dry up, rhinos will have to travel longer distances for a drink. They might not be able to find enough water to survive!

When there is less rain, some types of plants, such as grasses, begin to disappear. If there is no grass, some rhinos will starve.

Drought can also cause deserts to spread.
